1 Download

To use our Thermostat application, you have to download it first. You can download the APK file from the following adres: <http://updo.nl/file/f454c601.apk>. You have to do this on your phone, with the browser.

2 Allow third party applications

After downloading the application, you have to make sure that you are allowed to install third party applications. To do that, go to the *"Settings"* menu from your Android device. Now, click on the *"Applications"* button. Here you have to check the *"Unknown sources"* checkbox, to make sure that you are allowed to install our application.

3 Install

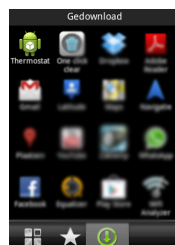

Now, you must click on the just downloaded file to install it. Depending on your phone settings, this can be usually found at the *"Notifications"*. Simply clicking on the downloaded files will usually start the installation. You will be notified when the installation is done.

3.1 Device requirements

Make sure that your phone is compatible with the application. The *"Thermostat"* application is developed for the *HTC Wildfire S*, but any Android device will do. But the application is optimized for *3.2 inch* screens.

4 Run

After installing, you can simply execute the Thermostat application by going to your application browser. The *"Android"* icon is from the Thermostat application, usually found at the top of your recently downloaded applications. Look for the following icon:

Now you can use the Thermostat software!

Please use the "User manual" provided with this software for more help and documentation.
